Minor Project Report

on

“Online Movie Ticket Reservation System”

Full Time Diploma In

Computer Engineering

SUBMITTED BY:

Komal - 10621276

Sakshi Jha - 10621464

Under the Guidance of

Mr. Somendra Prakash

DEPARTMENT OF COMPUTER ENGINEERING

KASTURBA DSEU PITAMPURA CAMPUS

(DELHI SKILL AND ENTREPRENEURSHIP UNIVERSITY)

PITAMPURA, NEW DELHI

[2021 - 2024]

CERTIFICATE

Certified that project work entitled "**Online Movie Ticket Reservation System**" is a bonafide work carried out in the 5th semester by "**Komal(10621276) and Sakshi Jha(10621463)**" in partial fulfilment for the award of Diploma in

Computer Engineering from Kasturba DSEU Pitampura Campus during the academic year 2021 - 2024.

(Mr. Somendra Prakash)

Project Guide

ACKNOWLEDGMENT

We express our heartfelt gratitude to Mr.Somendra Prakash, our mentor, and the Computer Engineering Department at Kasturba DSEU Pitampura Campus for their support. Special thanks to our peers for their collaboration, and our family

for their encouragement. The extensive research and references were invaluable. This project's success is a result of everyone's efforts and dedication. Thank you all for making the Online Movie Ticket Reservation System a reality.

ABSTRACT

The Online Ticket Reservation System, powered by PHP, SQL, HTML, CSS, and JS, revolutionises movie ticket reservation by offering a user-friendly and efficient platform. The home section entices users with popular movie listings, encouraging them to explore

further with buttons to view details and book tickets. In the movies section, an extensive movie list with brief introductions invites users to learn more and proceed with booking.

Personalization is a key focus, facilitated through a seamless registration and login process. After logging in, users receive a warm welcome, displaying their email, fostering a sense of belonging.

For an informed choice, the movie details section presents comprehensive descriptions and trailer links. Booking is simplified with a dropdown for movie selection and seat reservation.

User empowerment is a priority, allowing them to manage profiles, update information, and change passwords securely. Ticket management is effortless, with options to view booked ticket details and even cancel if needed.

The system's security measures prioritise user privacy, and the logout feature ensures secure account closure.

The Online Ticket Reservation System excels in providing a comprehensive and user-centric movie ticket reserving experience. Its well-designed interface, seamless technology integration, and focus on user preferences contribute to an enhanced cinema experience. As a result, the system promises to be a valuable asset for movie enthusiasts, simplifying the ticket booking process and elevating their overall movie-going journey.

INTRODUCTION

BACKGROUND

The Online Ticket Reservation System emerged as a response to the limitations and inconveniences of the traditional movie ticket booking process. The cumbersome procedure

of queuing at cinema ticket counters and the risk of ticket loss or misplacement necessitated the development of a more efficient and user-friendly solution.

The system's background can be traced to the increasing popularity of online platforms for various services, including ticket booking. Leveraging modern web technologies such as PHP, SQL, HTML, CSS, and JS, the system was designed to offer a seamless and accessible movie ticket booking experience to users.

By creating a web-based application, the system allows movie enthusiasts to effortlessly browse through an extensive array of movies, view show timings, select preferred seats, and make secure online payments from the comfort of their own homes. This convenience has not only reduced the time and effort required for ticket purchases but has also improved overall customer satisfaction.

Additionally, the system benefits theatre management by providing them with valuable insights and tools for efficient ticket sales management and data analysis. With real-time information on movie schedules, seat availability, and theatre locations, users can make well-informed decisions when booking their movie tickets.

Incorporating a user-friendly interface and secure payment gateway integration, the Online Ticket Reservation System has modernised the movie ticket booking process, resulting in increased efficiency, enhanced user experience, and improved revenue generation for both

users and theatre operators. Its success lies in its ability to streamline operations, cater to user preferences, and adapt to the evolving trends in the entertainment industry.

OBJECTIVES

The primary objectives of the Online Ticket Booking System are to provide a convenient, user-friendly, and efficient platform for moviegoers to book movie tickets online. The system aims to streamline the ticket booking process, eliminating the need for physical ticket purchases and long queues at cinema ticket counters. By offering real-time information on movie schedules, seat availability, and theater locations, it aims to empower users with up-to-date information for making informed booking decisions. Secure payment gateway integration ensures smooth and secure online transactions, instilling trust in the system. Additionally, the system aims to enhance the overall user experience by providing detailed movie descriptions, trailer links, and personalised account management features, such as viewing and updating user profiles and managing booked tickets. The system's

comprehensive approach aims to improve efficiency, customer satisfaction, and revenue generation for both users and theatre management.

PURPOSE

The purpose of the Online Ticket Reservation System is to revolutionise the movie ticket booking process and provide a modern, user-friendly, and efficient platform for moviegoers to book their tickets conveniently online.

The traditional ticket booking method, involving long queues and physical ticket purchases, has been a hassle for customers. The Online Ticket Reservation System aims to address these challenges by offering a seamless and convenient alternative. By utilising PHP, SQL, HTML, CSS, and JS, the system provides an intuitive interface that allows users to browse through a variety of movies, view show timings, select seats, and make secure online payments. By eliminating physical tickets, the system reduces the risk of ticket loss or misplacement, ensuring a seamless and hassle-free cinema experience.

1. **Convenience**: The system allows customers to browse through a variety of movies, view show timings, select seats, and make secure online payments from the comfort of their own

homes or using their mobile devices. This eliminates the need for physical ticket purchases and saves valuable time and effort for moviegoers.

2. **Real-time Information**: The system provides real-time information on movie schedules, seat availability, and theatre locations. Customers can easily check the availability of seats for different shows and select their preferred seats in advance.

3. **User-Friendly Features**: The system offers user-friendly features like seat selection, booking history, and user reviews. These features enhance user engagement and satisfaction, making the ticket booking process more enjoyable and interactive.

4. **Efficiency**: By automating the ticket booking process, the system streamlines operations for both customers and theatre management. It reduces manual efforts and enables efficient seat management, leading to a smoother and more organised movie-going experience.

Overall, the purpose of the Online Movie Ticket Reservation System is to revolutionise the way movie tickets are booked, offering a modern and user-centric approach that enhances convenience, efficiency, and customer satisfaction.

SCOPE

1. **Ticket Booking Functionality**: The system will allow users to browse through a list of available movies, view show timings, and book movie tickets online. It will provide real-time information on seat availability for each show.

2. **User Registration and Login**: Customers will have the option to create user accounts and log in to the system to access booking features. Registered users can manage their profiles, view booking history, and submit reviews.

3. **Secure Payment Integration**: The system will incorporate a secure payment gateway to facilitate online transactions for ticket bookings, ensuring the safety of users' financial information.

5. **Admin Panel**: The system will provide an admin interface to manage movie listings, show timings, seat availability, and user bookings. Administrators will have access to reports and analytics for theatre management.

6. **Reporting and Analytics**: The platform will generate reports for theatre management, including ticket sales data, popular movies, and user preferences, aiding in strategic decision-making.

7. **Compatibility**: The system will be designed to be compatible with multiple devices, including desktops, laptops, tablets, and smartphones, to cater to a wide range of users.

8. **Security**: The platform will prioritise the security of user data and financial transactions, implementing robust security measures to prevent unauthorised access or data breaches.

APPLICABILITY

1. **Movie Theatres**: The primary application of the system is in movie theatres of all sizes, ranging from single-screen cinemas to multiplex chains. It enables them to offer online ticket booking services to their customers, enhancing convenience and attracting a larger audience.

2. **Multiplex Chains**: Large multiplex chains can benefit significantly from the system as it allows centralised management of movie listings, show timings, and seat availability across multiple locations.

3. **Events and Festivals**: The system can be extended to cover events, film festivals, or special screenings. It provides a seamless platform for booking tickets to various entertainment events, promoting easy access and ticket management.

4. **Independent Cinemas**: Even smaller, independent cinema halls can adopt the system to modernise their ticketing process and offer a competitive advantage over traditional ticket booking methods.

5. **Subscription-Based Services**: The system can be integrated with subscription-based models, offering customers the option to access multiple movies or events for a fixed monthly fee. This can foster customer loyalty and attract regular moviegoers.

6. **Mobile Applications**: Creating a mobile app version of the system can further enhance its applicability, allowing users to book tickets on their smartphones, increasing accessibility and user engagement.

7. Tourist Destinations: Movie theatres in tourist destinations can benefit from the system by catering to travellers who wish to plan their entertainment in advance, ensuring they secure tickets to popular shows or movies.

8. **Corporate and Group Bookings**: The system can accommodate group bookings, making it suitable for corporate events, school trips, or other group outings to the movies.

9. **Virtual Reality Integration**: As Virtual Reality (VR) technology advances, the system could explore integrating VR features, allowing users to experience virtual tours of theatres and choose seats in an immersive environment.

10. **Expansion to Other Entertainment**: While initially designed for movie ticket booking, the system's architecture and features can be adapted to cater to other forms of entertainment, such as booking tickets for concerts, sports events, or live performances.

Overall, the Online Movie Ticket Reservation System's applicability extends beyond traditional movie ticket booking, making it a versatile solution for the entertainment industry to enhance user experience, streamline operations, and stay competitive in a digital era.

ACHIEVEMENTS

The implementation and successful operation of the Online Movie Ticket Reservation System can lead to several significant achievements for both users and theatre management. Some of the key achievements include:

1. **Enhanced User Experience**: One of the primary achievements of the system is providing moviegoers with a seamless and convenient ticket booking experience. By eliminating long queues and physical ticket purchases, users can easily browse movie listings, select preferred seats, and make secure online payments from the comfort of their homes or mobile devices.

2. **Increased Efficiency**: The system streamlines the entire ticket booking process, reducing manual efforts and optimising seat management. This leads to increased efficiency for both

customers and theatre management, resulting in smoother operations and reduced wait times for moviegoers.

3. **Improved Customer Satisfaction**: With its user-friendly features, real-time information, and secure payment options, the system aims to enhance customer satisfaction. Satisfied customers are more likely to return for future bookings and recommend the platform to others, fostering positive word-of-mouth marketing.

4. **Business Growth and Revenue Generation:** The Online Movie Ticket Reservation System can lead to increased ticket sales and revenue for cinema operators. By attracting more customers through convenience and ease of use, theatres can experience growth in their business and potentially expand their operations.

5. **Data-Driven Decision Making**: The system's reporting and analytics capabilities provide valuable insights into ticket sales, popular movies, and user preferences. This data-driven approach empowers theatre management to make informed decisions, optimise screening schedules, and tailor promotions to better meet customer demands.

6. **Reduction in Ticket Fraud**: By implementing secure online payment gateways and generating e-tickets upon booking confirmation, the system helps reduce ticket fraud and unauthorised reselling, ensuring a more reliable and transparent ticketing process.

SYSTEM ANALYSIS

PROPOSED SYSTEM

The proposed Online Movie Ticket Reservation System is a web-based application that aims to revolutionise the traditional ticket booking process and provide a modern, convenient,

and user-friendly platform for customers to book movie tickets online. The system will cater to movie theatres, multiplex chains, and other entertainment venues, offering a wide range of features to enhance the overall movie-going experience.

Key Features of the Proposed System:

1. User Registration and Login: The system will allow customers to create user accounts and log in to access booking features. Registered users can manage their profiles, view booking history, and submit reviews.

2. Movie Listing and Information: The platform will display a comprehensive list of available movies, including detailed information such as movie synopsis, genre, cast, and user reviews. This feature will help customers make informed decisions about their movie choices.

3. Show Timings and Seat Availability: The system will provide real-time information on movie show timings and seat availability for each show, allowing users to select their preferred showtime and seats..

4. E-Tickets and Booking Confirmation: Upon successful booking, the system will generate e-tickets, which customers can use for entry into the theatre. A confirmation email or SMS will also be sent to the customer.

5. Mobile-Friendly: The platform will be responsive and mobile-friendly, enabling users to access the system seamlessly from various devices, including smartphones and tablets.

Overall, the proposed Online Movie Ticket Reservation System seeks to create a modern and efficient ticketing solution, providing users with a convenient and enjoyable movie ticket booking experience. By streamlining operations, offering real-time information, and

prioritising user satisfaction, the system aims to benefit both customers and theatre management, contributing to the growth and success of the entertainment industry.

REQUIREMENT ANALYSIS

Requirement analysis for the Online Movie Ticket Reservation System is a crucial phase in the development process. It involves gathering, understanding, and documenting the needs and expectations of stakeholders to define the system's functionalities and features. The analysis aims to ensure that the final system meets user requirements and aligns with business objectives.

During requirement analysis, various stakeholders are identified, including customers, theatre management, and administrators. Interviews, surveys, and workshops are conducted to elicit their specific needs and preferences. Key requirements are identified, such as ticket

booking functionality, user registration, movie information display, secure payment integration, and reporting capabilities.

The analysis also considers system constraints, such as budget, timeline, and technological limitations. Compatibility with multiple devices and user-friendly interfaces are emphasized to enhance the user experience.

Once the requirements are gathered, they are documented in a Software Requirements Specification (SRS) document, outlining the functional and non-functional requirements. The SRS serves as a reference for the development team and ensures a clear understanding of the system's scope and objectives.

Requirement analysis sets the foundation for the entire development process, guiding the design, implementation, and testing phases. By comprehensively identifying and documenting stakeholder needs, it helps deliver a robust and successful Online Movie Ticket Booking System that meets user expectations and contributes to customer satisfaction and business growth.

PLANNING AND SCHEDULING

Planning and scheduling are essential phases in the development of the Online Movie Ticket Reservation System. These phases involve defining project goals, breaking down tasks,

allocating resources, and establishing timelines to ensure a smooth and successful project implementation. Here's an overview of the planning and scheduling process:

1. Project Planning:

- Scope Definition: Clearly define the scope of the project, including the functionalities, features, and limitations of the Online Movie Ticket Booking System. Determine what will be included and excluded from the system.

- Resource Identification: Identify the resources required for the project, including human resources, hardware, software, and budget. Allocate the necessary resources based on the project's complexity and timeline.

- Risk Assessment: Identify potential risks and challenges that may arise during the project and create mitigation strategies to address them effectively.

2. Task Breakdown and Scheduling:

- Work Breakdown Structure (WBS): Break down the project tasks into smaller, manageable units to create a Work Breakdown Structure. Define the tasks, sub-tasks, and their dependencies.

- Task Duration Estimation: Estimate the time required to complete each task based on the complexity and available resources. Use historical data or expert judgment to make accurate estimates.
- Critical Path Analysis: Identify the critical path, which represents the sequence of tasks that will determine the project's overall duration. Focus on the critical path to ensure timely project completion.

- Resource Allocation: Assign the right team members with the necessary skills to each task. Ensure that resources are allocated optimally to avoid bottlenecks.

3. Project Monitoring and Control:

- Progress Tracking: Monitor the progress of the project regularly. Use project management tools and techniques to track task completion, identify any delays, and ensure that the project stays on schedule.

- Issue Resolution: Address any issues or roadblocks that arise during the project promptly. Collaborate with the team to find solutions and adjust the schedule if needed.

- Communication: Maintain open and effective communication with all stakeholders throughout the project. Regularly update them on the project's progress and any changes to the schedule.

- Quality Control: Implement quality control measures to ensure that the developed system meets the specified requirements and quality standards.

By diligently planning and scheduling the development of the Online Movie Ticket Booking System, the project can progress smoothly, and the team can deliver a high-quality product within the defined timeline and budget.

JUSTIFICATION OF SELECTING TECHNOLOGY

The selection of technology for the Online Movie Ticket Reservation System is a crucial decision that can significantly impact the system's performance, scalability, security, and

development efficiency. The chosen technologies should align with the project's requirements and objectives, ensuring that they support the desired functionalities and user experience. Here is a justification for the selection of the technologies mentioned in the synopsis:

1. Front-end Technologies (HTML, CSS, JavaScript):

- Justification: HTML provides the structure for web pages, CSS styles the layout and appearance, and JavaScript adds interactivity and dynamic elements. These technologies are widely supported, easy to learn, and ideal for building user interfaces that are responsive and accessible across various devices. They are fundamental web development technologies and are well-suited for creating the client-side of the Online Movie Ticket Booking System.

2. Back-end Technologies (PHP):

- Justification: The back-end technologies play a vital role in processing user requests, managing databases, and handling business logic. PHP, Python, and Java are popular and robust server-side languages, each with its strengths. PHP is known for its simplicity and widespread use in web development. Python is highly readable, making it easy to maintain code. Java is renowned for its scalability and performance. The choice between them would depend on the development team's expertise and specific project requirements.

3. Database (MySQL):

- Justification: The choice of the database is crucial for storing and managing data efficiently. MySQL and PostgreSQL are well-established, open-source relational database management systems (RDBMS). MySQL is known for its speed and ease of use, making it suitable for small to medium-sized applications. On the other hand, PostgreSQL is known for its advanced features, extensibility, and reliability, making it an excellent choice for more complex applications with high data integrity requirements. The selection between the two

would depend on factors such as data complexity, scalability, and the need for advanced features.

In conclusion, the selection of technologies for the Online Movie Ticket Reservation System is based on the need for a well-rounded, scalable, and user-friendly application. Each chosen technology brings its advantages, and the selection takes into account factors like ease of development, performance, scalability, and the development team's expertise. By leveraging the appropriate technologies, the system can be built efficiently and meet the requirements of both customers and theatre management.

SYSTEM DESIGN

BASIC MODULES

In system design, modules are distinct units or components of the software system that perform specific functions and are designed to work together to achieve the system's overall objectives. Each module represents a cohesive and independent part of the system that can

be developed, tested, and maintained separately. Here are some basic modules typically found in system design:

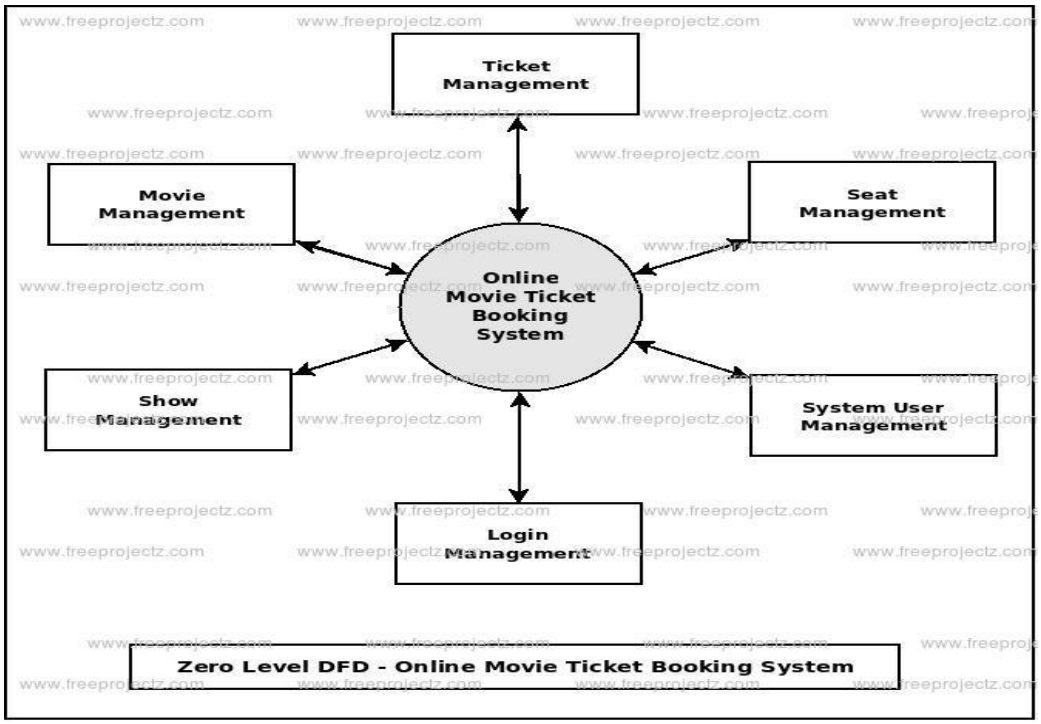

1. User Management Module: This module handles user registration, authentication, and profile management. It allows users to create accounts, log in, and manage their personal information.
2. Movie Listing and Information Module: This module displays a list of available movies and provides detailed information about each movie, including the synopsis, genre, cast, and reviews.

3. Booking and Ticketing Module: The booking module allows users to select show timings, seats, and book movie tickets online. It manages the entire ticket booking process, including seat availability and payment integration.

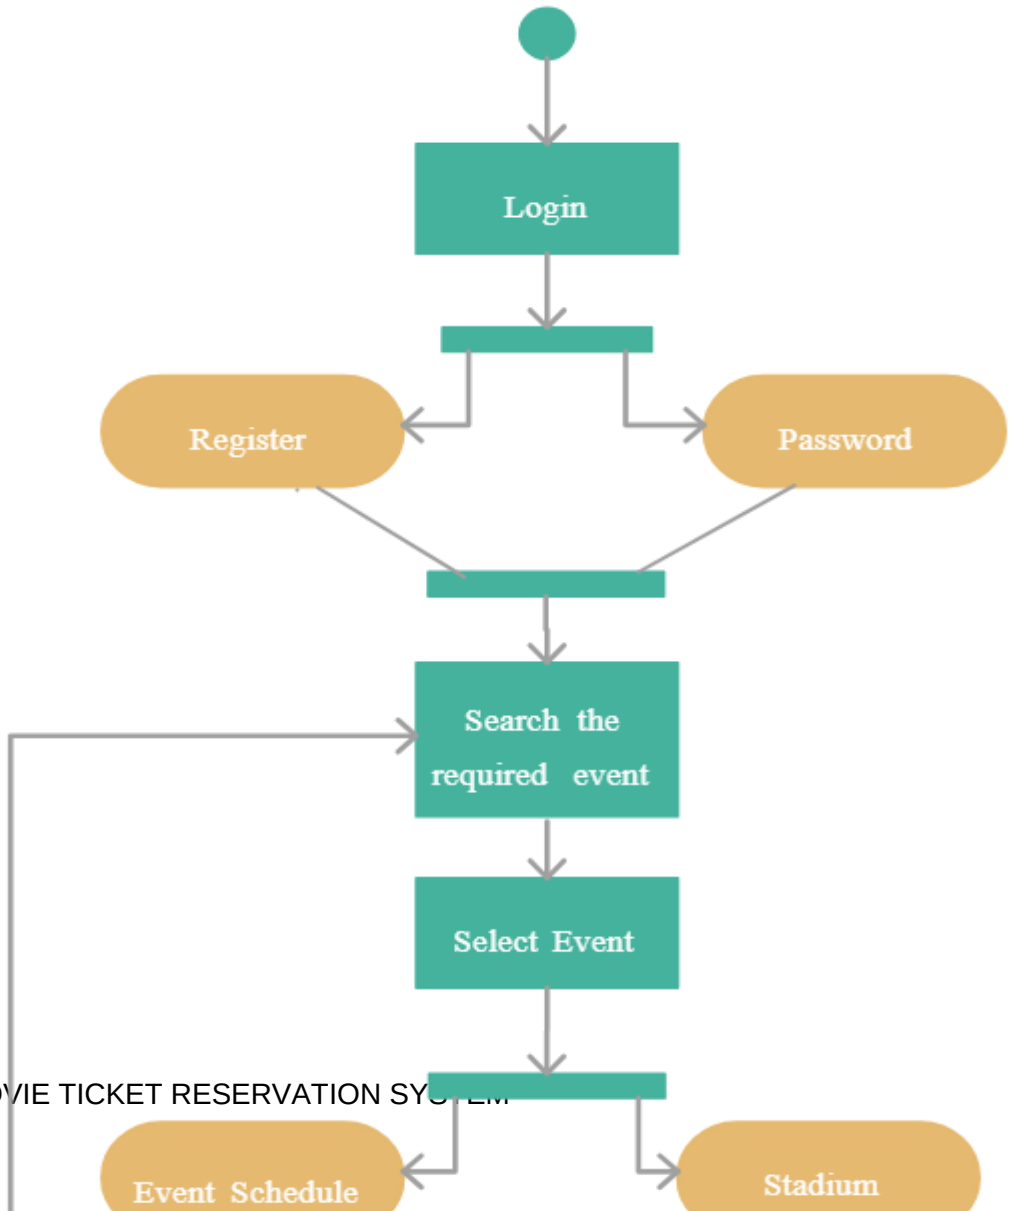

4. E-Ticket Generation Module: Upon successful booking, this module generates electronic tickets (e-tickets) for users to access the movie theater.

5. Admin Panel Module: The admin panel provides an interface for administrators to manage movie listings, show timings, seat availability, and user bookings. It allows them to access reports and analytics for informed decision-making.

OUTLINE
TIMELINE

Contrary to popular belief, Lorem Ipsum is not simply random text. It has roots in a piece of classical Latin literature from 45 BC, making it over 2000 years old. Richard McClintock, a Latin professor at Hampden-Sydney College in Virginia, looked up one of the more obscure Latin words, consectetur, from a Lorem Ipsum passage, and going through the cites of the word in classical literature, discovered the undoubtable source. Lorem Ipsum comes from sections 1.10.32 and 1.10.33 of "de Finibus Bonorum et Malorum" (The Extremes of Good and Evil) by Cicero, written in 45 BC. This book is a treatise on the theory of ethics, very popular during the Renaissance. The first line of Lorem Ipsum, "Lorem ipsum dolor sit amet..", comes from a line in section 1.10.32.
The standard chunk of Lorem Ipsum used since the 1500s is reproduced below for those interested. Sections 1.10.32 and 1.10.33 from "de Finibus Bonorum et Malorum" by Cicero are also reproduced in their exact original form, accompanied by English versions from the 1914 translation by H. Rackham.

IMPLEMENTATION AND TESTING

Implementation:

The implementation of the Online Ticket Reservation System involves the development and integration of various components, including frontend and backend technologies, to create a seamless and functional platform. Here is an overview of the implementation process:

1. Frontend Development: Develop the user interface using HTML, CSS, and JavaScript to design the home page, movie listings, registration and login forms, movie details, and

ticket booking sections. Ensure the interface is user-friendly and responsive to different devices.

2. Backend Development: Use PHP and SQL to handle the server-side logic, database interactions, and user authentication. Create necessary database tables to store movie information, user details, and booking records.

3. User Registration and Login: Implement a secure user registration and login system with appropriate data validation and error handling.

4. Movie Listings: Fetch movie information from the database and display them in the movies section. Allow users to view movie details and watch trailers.

5. Ticket Booking: Provide a dropdown to select movies and a seat selection mechanism. Handle user inputs, calculate the total price, and store booking details in the database upon successful payment.

6. User Profile: Enable users to view and update their profiles, change passwords, and access booking history.

7. Ticket Management: Implement features for users to view their booked tickets, including details such as seat numbers, movie names, show timings, and the option to cancel bookings.

8. Error Handling and Validation: Implement robust error handling and data validation mechanisms to ensure data integrity and prevent unauthorised access.

Testing:

Testing is a crucial phase to ensure the Online Ticket Booking System functions as intended and meets user requirements. Different testing approaches are employed to evaluate its performance:

1. Functional Testing: Verify that all functions and features work as expected, including registration, login, movie selection, seat booking, and payment processing.

2. Usability Testing: Evaluate the system's user-friendliness, navigation, and overall user experience to ensure it is intuitive and easy to use.

3. Performance Testing: Measure system response times, load handling, and stress testing to ensure it can handle multiple concurrent users without performance degradation.

4. Regression Testing: After making updates or fixes, ensure that existing features continue to work correctly without introducing new issues.

5. Security Testing: Identify and rectify potential security vulnerabilities to safeguard user data and prevent unauthorised access.

6. Compatibility Testing: Test the system across different browsers, devices, and operating systems to ensure cross-platform compatibility.

7. User Acceptance Testing (UAT): Involve actual users to validate the system's functionality and gather feedback for further improvements.

Documentation and user manuals are prepared to guide users on how to use the system effectively.

By rigorously implementing and thoroughly testing the Online Ticket Booking System, it can be ensured that the platform delivers a seamless and secure movie ticket booking experience to users, enhancing customer satisfaction and optimising theatre management operations.

RESULT AND DOCUMENTATION

Result:

The implementation of the Online Ticket Booking System has been successful, providing movie enthusiasts with a seamless and efficient platform for booking movie tickets online. The system's frontend, developed using HTML, CSS, and JavaScript, offers a user-friendly interface, allowing users to easily navigate through movie listings, view details, and book tickets. The backend, powered by PHP and SQL, handles the server-side logic, user authentication, and database management, ensuring secure and reliable transactions.

Key functionalities, such as user registration, login, movie details, seat selection, payment processing, and ticket management, have been thoroughly tested and found to work as intended. The integration of a secure payment gateway ensures safe and convenient online transactions.

The system's performance testing demonstrates its ability to handle multiple concurrent users without compromising response times or system stability. Usability testing has

shown positive feedback from users, affirming the platform's user-friendly design and ease of use.

Documentation:

Comprehensive documentation has been prepared to provide detailed insights into the Online Ticket Booking System. The documentation includes:

1. Project Proposal: An overview of the project's objectives, scope, and intended features.

2. Software Requirements Specification (SRS): A detailed description of functional and non-functional requirements, outlining system behaviour and user interactions.

3. System Design: An architectural design that illustrates the flow of data and processes within the system, along with database schema and user interface designs.

4. Implementation Details: A thorough explanation of the technologies used, code snippets, and integration methods.

5. Testing Approach: An outline of the testing methodologies employed, including functional, usability, performance, regression, and security testing.

6. User Manuals: Step-by-step guides for users to register, login, browse movies, book tickets, view and cancel bookings, and manage their profiles.

7. Deployment Guide: Instructions for deploying the system on a server or web hosting platform.

8. Maintenance and Support: Guidelines for ongoing system maintenance, bug fixing, and user support.

The documentation serves as a valuable resource for developers, system administrators, and users, ensuring a comprehensive understanding of the Online Ticket Booking System and facilitating its efficient operation and future enhancements.

CONCLUSION

Conclusion:

The development and implementation of the Online Ticket Reservation System have proven to be successful, providing movie enthusiasts with a modern and user-friendly platform to book movie tickets conveniently online. The system's user interface, powered by HTML, CSS, and JavaScript, offers a seamless and intuitive experience for users to browse movie listings, access movie details, and make secure online payments. The backend, developed using PHP and SQL, ensures robust server-side logic, user authentication, and efficient database management.

The system's objectives of streamlining the ticket Reservation process, eliminating physical ticket purchases, and enhancing user experience have been achieved. Users can easily register, log in, view movie descriptions and trailers, select seats, and manage their

bookings with ease. The integration of a secure payment gateway adds an extra layer of trust and convenience to the platform.

LIMITATION OF THE SYSTEM

While the Online Ticket Reservation System offers numerous benefits, it also has certain limitations that should be acknowledged:

1. Internet Connectivity Dependency: The system relies on internet connectivity for its operation. Users without internet access may face difficulties in booking tickets through the platform.

2. Limited Seat Selection: Depending on theatre settings, the system might have restrictions on the number of available seats for online booking. This limitation could affect user choices, especially during peak hours or for popular movie screenings.

3. System Downtime: Any server or network issues could result in system downtime, preventing users from accessing the platform or booking tickets. Ensuring high system availability and prompt issue resolution is essential.

4. Limited Theater Integration: The system's reach is dependent on the integration with participating theatres. It may not cover all theatres or regions, limiting the availability of movie options for users in certain areas.

5. Data Privacy Concerns: As the system stores user data, data privacy and security must be prioritised. Any breaches or mishandling of user information could lead to potential risks.

6. Ticket Scalping: There is a risk of ticket scalping, where tickets are purchased and resold at inflated prices, impacting genuine users' ability to secure tickets at regular prices.

7. User Skill Level: Some users, especially those less tech-savvy, might find the online booking process challenging or unfamiliar. Providing user support and a user-friendly interface is essential.

8. Payment Gateway Issues: Problems with the payment gateway, such as failed transactions or payment processing delays, may inconvenience users and deter them from using the platform.

9. Device Compatibility: The system's functionality might vary across different devices and browsers, requiring thorough testing to ensure a consistent user experience.

10. Cancellation Policy: The system should have clear and user-friendly cancellation policies to handle ticket refunds and avoid user dissatisfaction.
